

CSS Background & Gradient Properties

background-color – Sets the background color of an element.

background-image – Adds an image as background.

background-repeat – Controls image repeating. Common values are repeat, no-repeat.

background-position – Sets the position of the background image.

background-size – Controls image size. Common values are cover and contain.

background-attachment – Controls scroll behavior of background.

background-origin – Defines where the background starts from.

background-clip – Defines how far the background spreads.

background shorthand – Allows setting all background properties in one line.

Example: `background: red url(img.png) no-repeat center / cover;`

linear-gradient() – Creates a smooth color transition in a straight line.

radial-gradient() – Creates a smooth color transition from center outward.

conic-gradient() – Creates a circular color transition around a point.

Gradients are treated like background images in CSS.
