HTML & CSS Exercise – Style Tag Basics

Today's exercise is only about using the **<style>** tag inside HTML. No external CSS. No inline CSS. Only style tag. You will practice targeting elements directly, using id, and using class.

Rules:
Use only these CSS properties: height, width, background-color, color.
Do not use anything else.

Exercise 1: Element Selector

Create a page with one **h1** and two **p** tags.
Using the style tag, change the text color of all p tags.
Give the h1 a background color and fixed width.

Exercise 2: ID Selector

Create two divs.
Give one div an id.
Using the style tag, set height, width, and background color only for that id.
The other div should remain unchanged.

Exercise 3: Class Selector

Create three elements of your choice (p, div, span, etc).
Give all three the same class.
Using the style tag, apply text color and background color using the class selector.

Important:
Write CSS only inside the style tag.
Selectors allowed: element, id, class.
Properties allowed: height, width, background-color, color.
